

WaterGuard Dispenser Filter for Regular and Alcohol Fuels

WaterGuard Fuel Dispenser Filters contain a patented water removing chemistry that allows them to bond to the hydrogen atom of the H₂O molecule which chemistry is described in US Patent No. 7,425,266-B2. This ability allows WaterGuard Filters to remove any water that may be in gasoline or diesel fuel, even if the water has bonded to the separated alcohol that can form in alcohol blended gasoline or biodiesel.

WaterGuard Dispenser Filters remove solids to ten micron size can remove 12-ounces of water or water separated alcohol and on reaching their water holding capacity they will slow their flow to alert the operator that the filter will soon need changing.

WaterGuard Filters can be used with regular gasoline, diesel fuel, alcohol blended gasoline, and biodiesel and if the filter starts to require frequent change outs, the filter is alerting you that water or water caused alcohol separation can be developing in the tank.

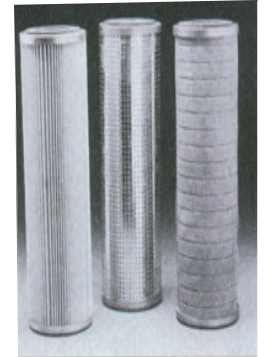

When this happens the “WaterGuard Tank Cleaning System” can be used to transfer the water and separated alcohol from the tank bottom to drums in order to allow the water to settle from the fuel and then this system will filter the remaining fuel in the tank to remove solids and the water that is held suspended by the blended alcohol.
